

Coding Exercise

3-4 hours

Scenario: We recently redesigned the sign up flow and first time user experience on Fieldwire. We need to automate the onboarding flow and ensure a delightful experience to the Fieldwire platform.

Please automate the sign up flow, create a new project, and create a new task once in the newly created project. Sign up flow experience begins at app.fieldwire.com.

Any web automation framework + programming language can be used (selenium-web driver, Cypress.io, etc.). You can use any format to write the tests (i.e. page object model not required).

Treat this exercise as if you were part of the team. Feel free to ask questions if you are completely stuck or use any of your favorite resources such as Google, Stack Overflow etc.

Primary Objective

- Write 4-5 working end to end UI tests that can run on a web browser successfully (no preference for browser)

Extra Credit

- Write more than 5 UI tests, including negative scenarios
- Setup tests to run on more than one browser
- Identify what qualifies to be part of a smoketest and/or regression.
- Identify any bugs along the way
